Example 4: Page 185-188; 249pp; English.

Recombinant turkey herpes virus (TH) which comprise a foreign DNA sequence encoding a cytokine inserted into a Khol site within an ECORI #9 genomic fragment, where the cytokine can be expressed in host cells infected with the virus can be used in vaccines to protect turkeys against avian viruses. The recombinant viruses can be used for immunising birds against infectious bronchitis virus (IBV), infectious laryngotracheitis virus (ILV) and Newcastle disease (MDV) infectious laryngotracheitis virus (ILV) and Newcastle disease virus (NDV). They may also be used in multivalent vaccines to protect against two or more of these avian viruses. This sequence is the major neutralsing antigen of infectious bronchits virus and commenced in the recombinant vaccines.

                                                                                                                                               New human TSC-22-like protein - for treatment, prevention and diagnosis of developmental, respiratory and neurological disorders claim 18; Fig 2; 65pp; English.

Claim 18; Fig 2; 65pp; English.

This is the amino acid sequence of the human TSC-22-like protein-2 (HT2D-2) used in the method of the invention used in the treatment, and diagnosis of developmental respiratory and neurological disorders. Other uses for HT2L-2 include generation of antibodies and screening for specific binding agents (potential therapeutics). HT2L-2 and its fragments are used as antisense/ribozyme therapeutics, for detecting and quantifying gene expression (as probes and primers in standard hybridisation and amplification assays), for isolating related sequences and for chromosome mapping. Antibodies are used directly as therapeutic antagonists, as immunoassay reagents for diagnosis or isolate HT22L-2 from natural sources.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           N-PSDB; N60679.

This sequence represents the S-adenosylmethionine synthase 1 (saml) protein. The DNA encoding this sequence may be used in producing plants which are resistant to alkaline soil.

Claim 2; Page 6-7; 13pp; Japanese.
This sequence represents the S-adenosylmethionine synthase 2 (sam2) protein. The DNA encoding this sequence may be used in producing plants which are resistant to alkaline soil.
Sequence 394 AA;
                                                                                                                                                                                                                                                                                                                                                                    resistant to alkaline soil
Claim 3; Page 7-8; 13pp; Japanese.
This sequence represents the S-adenosylmethionine synthase 3 (sam3)
protein. The DNA encoding this sequence may be used in producing plants
which are resistant to alkaline soil.
                                                                                                                                                                                                                                                                   sam3; barley; alkali resistant plant.

Claim 13; page 151; 224pp; English.

This cytochrome P450 enzyme, P450sUl is expressed alongside the iron sulphur protein Res. B, by a DNA sequence contained in a recombinant plasmid. Host Streptomyces species are transformed with the plasmid and are used to coat a plant seed to transform the plant. The res-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        changes to 16 amino acids, compared to the unedited version. The unedited COX II is preferred because it results in male-sterility by inhibiting pollen production in transgenic plants.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         07\text{-APR-}1995 (first entry) Yeast presequence COX IV-wheat COX II (unedited) fusion protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    3;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Beta-chain of human granulocyte-macrophage CSF receptor - used for screening agonists and antagonists of human GM-CSF, e.g. for diagnosing myeloid leukamists of human GM-CSF, e.g. for Claim 2, Page 15-18, 20pp, English.

The nucleic acid encoding the human GM-CSF beta-chain is isolated from a cDNA library prepd. from poly(A)+ RNA from TF-1 cells. The high affinity human GM-CSF receptor (Kd < 1 nM) can be used for screening candidate GM-CSF agonists and antagonists e.g. for

                                                                              Contraction of the color process and the mandmailed basement memorane heparan color solidate proteoglycan."

1. Sulfate proteoglycan."

2. I-FUNCTION: PROBABLE ROLE IN MYOFILAMENT ASSEMBLY AND/OR ATTACHMENT OF THE MYOFILAMENT LATTICE TO THE CELL MEMBRANE. UNC-52 MAY BE AN EXTRACELLULAR MACHOR FOR INTEGRIN RECEPTORS IN MUSCLE.

2. EXTRACELLULAR LOCATION: EXTRACELLULAR MATRIX.

2. I-SUBCELLULAR LOCATION: EXTRACELLULAR MATRIX.

3. CONTRACTIVE PRODUCTS: UNC-52 PRODUCES AT LEAST THREE POLYPEPTIDES:

4. ALTESNEE SPECIFICITY: FOUND IN THE BASEMENT MEMBRANE OF ALL CONTRACTILE TISSUES: IT IS CONCENTRATED OVER MUSCLE DENSE BODIES

3. CONTRACTILE TISSUES: IT IS CONCENTRATED OVER MUSCLE DENSE BODIES

4. SIMILARITY: CONTAINS 3 LDL-RECEPTOR CLASS A DOMAINS.

5. I-SIMILARITY: CONTAINS 1 LIMMUNOGLOBUIN-LIKE C2-TYPE DOMAINS.

5. SIMILARITY: CONTAINS 2 LAMININ BGF-LIKE DOMAINS.

6. SIMILARITY: TO PERLECAN.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           PFAM; PF00047; ig; 16.

COCRACTOR: FAD; REQUIRES FE(+2) FOR ACTIVITY.
PATHWAY: FIRST STEP IN TOLUENE DEGRADATION.
SUBDINT: THE MULTICOMPONENT ENZYME TOLUENE-4 MONOOXYGENASE
IS FORMED BY THE TMOA, TWOB, TMOE, TMOE AND TMOF
POLYPEPTIDES.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              01-NOV-1995 (Rel. 32, Last sequence update)

Fausset P.R., Lu H.S., Harcourt A.A., Chen K.K.;
Follohing and characterization of a Pseudomonas mendocina KRI gene
cluster encoding toluene-4-monooxygenase.";
J. Bacteriol. 173:5315-5327(1991).
-I- FUNCTION: HYDROXYIATES TOLUENE TO FORM P-CRESOL.
-I- COPACTON: FIRST STEP IN TOLUENE DEGRADATION.
-I- PATHWAY: FIRST STEP IN TOLUENE DEGRADATION.
-I- SUBUNIT: THE MULTICOMPONENT ENZYME TOLUENE-4-MONOOXYGENASE
IS FORMED BY THE TMOB, TMOB, TMOD, TMOD, TMOE AND TMOF
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Bacteria; Proteobacteria; gamma subdivision; Pseudomonas group;

FUNCTION: THIS ENZYME COMPLEX CATALYZES THE FINAL STEP IN BETHANOGENESIS. WHICH IS THE TERMINAL STEP OF ANAEROBIC DEGRADATION OF BIOMASS. CATALYTIC ACTIVITY: REDUCTION OF METHYL-COENZYME M (2-(METHYLTHIO)
                                                                                                                                                                                                                                                                                             SUBUNIT: HEXAMER OF TWO ALPHA, TWO BETA, AND TWO GAMMA CHAINS.

BUSUELOPMENTAL STRACE: THERE ARE TWO MCR COMPLEXES IN THIS BACTERIA.

MCR II IS EXPRESSED IN THE EARLY GROWTH PHASE. LATE GROWTH CELLS
CONTAINS MOSTLY MCR I.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              141 LRHYQTETH----AMSTYNKFFNGFHHSNQWFDRVWYLSVPKSFFED------AYSSGPF 190

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Dolyprotein - bovine leukemia virus
N; Contains: endonuclease (EC 3.1.-.-); RNA-directed DNA polymerase (EC 2.7.7.49)
C; Species: bovine leukemia virus, BLV
A; Note: host Bos sp. (cattle)
C; Date: 28-Aug-1985 #sequence_revision 28-Aug-1985 #text_change 01-May-1998
C; Accession: A03960
